SUMMARY

Results-driven Flutter Developer with 3+ years of experience architecting and shipping cross-platform mobile applications for Android and iOS. Proven track record of taking products from Figma handoff through to production release, with expertise spanning Provider, BLoC, and Clean Architecture, scalable design systems, RESTful API integration, and real-time, interactive UI features. Adaptive to the use of AI coding agents to increase development velocity and streamline delivery.

EDUCATION

Bachelor of Software Engineering Dec 2020 – Feb 2024
COMSATS University, Islamabad

SKILLS

- | | | |
|------------------------------|-----------------------------------|---------------------------------|
| • Flutter & Dart | • Widget Tree & Rendering | • Cross-Platform (iOS/Android) |
| • Provider, BLoC/Cubit, GetX | • Clean Architecture (MVVM) | • Dependency Injection (get.it) |
| • REST APIs | • Firebase (Firestore, Auth, FCM) | • Local Storage (SQLite/Hive) |
| • Unit & Widget Testing | • Performance Optimization | • UI/UX Implementation |
| • Design Systems | • Localisation (RTL, ARB) | • Git & GitHub |
| • App Store & Play Console | • Agile / Scrum | • SDLC |
| • CI/CD (Jenkins) | • AI Coding Agents | |

WORK EXPERIENCE

Flutter Developer Feb 2024 – Present
Splenify (Remote)

- Shipped multiple cross-platform Flutter apps to production, owning the full cycle from Figma design handoff to Android and iOS release.
- Architected scalable app structures using **Provider, BLoC/Cubit, and GetX** state management within a **Clean Architecture** (MVVM) layering, paired with a custom design token system (**AppTheme/AppText**), reducing UI rework and enforcing separation of concerns.
- Built **reusable widget systems and custom component libraries** — including animated transitions, slivers-based scroll layouts, and adaptive/responsive UI — to enforce visual consistency and accelerate development velocity across multiple client products.
- Established an **ARB-based localisation** workflow with full RTL support, standardising a previously ad hoc process across the codebase.
- Integrated **Firebase, Firestore, and RESTful APIs** for real-time data sync and backend connectivity, added **local persistence (SQLite/Hive)** for offline-first flows, wired up **dependency injection (get.it)** for testable service layers, and implemented **push notifications** via Firebase Cloud Messaging.
- Wrote **unit and widget tests** for critical user flows and profiled UI performance to sustain smooth frame rates, conducting cross-device QA on Android and iOS ahead of each release.
- Managed **Android/iOS platform compliance**, from manifest/permission handling to App Store distribution, code signing, and archive resolution.
- Leverage **AI coding agents** (Claude Code, Figma MCP workflows) to accelerate feature development and speed up design-to-code handoff across the team.

Flutter Developer May 2026 – Sep 2026
Prompt Sphere (Remote)

- Developed **Dime Dropper**, a cross-platform Flutter sports application, from the ground up as an early-stage mobile app development engagement.
- Built comprehensive **tournament and fan-engagement features**, including tournament brackets and leaderboards, a fan home module, real-time content feeds, live game engagement tools, predictions and voting systems, and in-app notifications.
- Established the **core design system, reusable UI component library, and app architecture** — using **Provider** for state management and **GoRouter** for navigation — that later served as the foundation for subsequent product development.
- Implemented **REST API integration and Firebase services** for authentication, real-time data, and content delivery, applying clean code and **SOLID** principles to ensure scalable, maintainable Android and iOS builds.
- Managed the **iOS release pipeline**, including resolving build and framework configuration issues, handling **App Store Connect** signing and provisioning, and coordinating **TestFlight** distribution for beta testing.
- Collaborated in an **Agile / Scrum** environment with designers and backend engineers to translate **Figma** designs into pixel-accurate, production-ready UI, including custom animations and micro-interactions.

PROJECTS

FanHub

Developed and maintained a cross-platform Flutter sports fan-engagement application supporting live games, fan communities, team discovery, and interactive experiences. Owned the implementation of complex modules including a **real-time basketball scoring system** with court visualization, landscape layouts, multi-step stat tracking, and quarter-by-quarter game management. Built the threaded **Game Thread**, Donation Hub, tournament and leaderboard experiences, ticket purchasing flow, FanWall, Predictions/Voting, team detail screens, and campaign creation workflows. Implemented live streaming experiences including **Go Live** and EngageLive interactions. Structured navigation using **GoRouter**, managed screen-level state with **Provider**, and established reusable **AppTheme/AppText** design tokens and shared components across 15+ screens. Also handled production release requirements, including permission compliance and iOS archive/distribution issues for App Store releases.

Community At

Developed and maintained a Flutter-based community platform combining local marketplace listings, events, direct messaging, and bookable expert sessions. Owned the implementation of core user-facing experiences including **community details, marketplace discovery and listing flows, event discovery, real-time chat, expert booking, and profile onboarding**. Built reusable contextual action menus and multi-criteria filter bottom sheets to improve content discovery and user navigation. Implemented the application's **ARB-based localization and internationalization system**, resolving translation and RTL rendering issues across multiple screens. Extended the theming and shared UI architecture to maintain visual consistency and support scalable feature development.

MogWars

Developed a Flutter-based ranking and competition app using **Dart**, featuring skill-based leaderboards, real-time ranking updates, player profiles, and referral functionality. Built **MogOff**, an in-app live streaming feature that enables top-ranked players to broadcast content to followers. Designed and implemented the complete onboarding flow and a reusable UI component system from the ground up, maintaining a consistent and scalable application architecture.

AutoAid

Developed a Flutter-based on-demand mechanic booking application using **Dart**, enabling users to request roadside assistance and vehicle repair services in real time. Integrated an **AI-powered chat assistant** to analyze reported vehicle issues and recommend suitable services before booking. Implemented real-time mechanic location tracking, service request management, multi-step booking flows, and job status tracking, with a focus on reusable Flutter widgets, responsive UI, and maintainable application architecture.
